New Statistics Approach - October 2004 Distributions were fitted to the data and 3-Sigma values were derived for the best-fit distribution and for the distribution with the biggest 3-Sigma ( of distributions considered ). These values are point estimates that control only the probability that a single defect chosen at random will not exceed that size. Frequency of the defects in flight is not considered. For each defect estimate for a part, the determination of an expected maximum begins with the 3-Sigma from the grouped data. This estimated can be increased by information from part-specific geometry or reduced to accommodate any hardware foam thickness constraints.
